Growth Projection

Model, fit and sensitivity

Nigeria Music Analytics System

Delivery 130 · 129 artists · Q1 2019 – Q3 2026

1 September 2026

Growth projection — 130-artist cohort

Model

$$\ln(\text{revenue}_t) = a + b \cdot t + s2 \cdot Q2 + s3 \cdot Q3 + s4 \cdot Q4$$

Log-linear because the series compounds: it runs from \$1,872,809 to \$27,542,908, and a straight line on the level would fit the tail and ignore the base. Quarterly dummies because the seasonality is real and one-directional — Q1 is the weakest quarter in three separate years, after the December peak.

Why the whole series is NOT fitted

The series contains a structural break. Trailing-twelve-month growth ran +102% to Q2 2022, fell to +4% through 2025, and is re-accelerating to +12% by Q2 2026 — the market matured as provider coverage stopped expanding and the base grew. Fitting all 30 quarters returns +41.9%/year and projects Q4 2026 at \$55M against a last observed quarter of \$28.6M: it fits the 2019–2021 base effect and calls it the future.

The projection is fitted on the **last 12 complete quarters (Q3 2023 – Q2 2026)**. Q3 2026 is excluded separately: the revenue series end 2026-08-11 (45.7% of the quarter) and the quarter closes 2026-09-30, so it is an outturn in progress, not a data point.

Window sensitivity

Window	Period	Annual growth	R ²
8 quarters	Q3 2024 – Q2 2026	+9.98%	0.8561
12 quarters (used)	Q3 2023 – Q2 2026	+8.19%	0.9121
16 quarters	Q3 2022 – Q2 2026	+10.32%	0.8479
20 quarters	Q3 2021 – Q2 2026	+20.09%	0.7736
30 quarters	Q1 2019 – Q2 2026	+42.26%	0.8910

Fit

Statistic	Value
Quarterly growth rate	1.99%
Implied annual growth	8.19%
R ² (log scale)	0.9121
Residual sigma (log)	0.0299
Q2 seasonal effect	+7.57%
Q3 seasonal effect	+6.23%
Q4 seasonal effect	+3.61%

Seasonal effects are relative to Q1, the base quarter.

Projection — 8 quarters forward

Quarter	Projected USD	95% lower	95% upper
Q4 2026	\$26,641,062	\$25,114,348	\$28,235,362
Q1 2027	\$26,224,069	\$24,721,252	\$27,793,415
Q2 2027	\$28,770,807	\$27,122,045	\$30,492,559
Q3 2027	\$28,976,807	\$27,316,239	\$30,710,887
Q4 2027	\$28,823,544	\$27,171,759	\$30,548,452
Q1 2028	\$28,372,390	\$26,746,460	\$30,070,300
Q2 2028	\$31,127,762	\$29,343,930	\$32,990,563
Q3 2028	\$31,350,637	\$29,554,033	\$33,226,776

What this is not

Every projected figure is **EST** — a statement about quarters that have not happened. It must never be presented beside observed revenue without that label, and it must never be summed into an observed total.

The intervals are prediction intervals from the fitted residual spread. They express the model's own uncertainty. They do **not** express the risk that the model is the wrong shape — that a platform changes its payout, that a provider changes what it reports, or that the market breaks trend. No interval can. The 20- and 30-quarter rows in the sensitivity table are there precisely to show how much the answer moves with that judgement.

The projection also inherits every assumption in the revenue it is fitted to: the per-stream rates, the 3.5 streams/listener multiplier and the 0.30 unmeasured-platform uplift are ASM/EST, so the LEVEL being projected is itself an estimate. The GROWTH RATE is more robust than the level, because those constants scale both ends of the series equally.
