DELIVERY130 — Nigeria Music Analytics System

Submission package for the National Bureau of Statistics

129 artists x 31 quarters, Q1 2019 – Q3 2026. Generated 2026-09-01.

Headline	Value
Gross streaming revenue (EST), all 31 quarters	\$469,833,610
— of which Q3 2026, an INCOMPLETE quarter	\$28,424,708
Gross streaming revenue, COMPLETE quarters only	\$441,408,902
In naira, at 1,500/USD	₦704,750,415,210
Artists	129
Quarters	31
Artist-quarter revenue rows	3,798
Quarters with a measured export split	23 of 31
Projected annual growth	8.192%

The cohort

These are the artists of the first submission. That submission's master list holds **131 rows** but describes **129 artists**. 2 pairs are one person carried twice under two provider UUIDs:

- **Flavour** and **Flavour N'abania**
- **Odunsi (The Engine)** and **Odunsi**

This package counts people, so it carries 129. No artist has been added to pad the list and none has been dropped. The second pair was found by independent verification after the package was first built, not by the pipeline — the earlier count of 130 was wrong and is corrected here.

Arrangement

The file structure and column layout follow the first submission exactly, so the two packages can be read side by side and diffed:

```
delivery130/
  01_Executive_Summary/    Executive_Summary.md
  02_Methodology/         Methodology_and_Sources.md
  03_Excel_Deliveries/     1..9 workbooks, numbered as the first submission
  04_Datasets/             the CSVs, same columns as the first submission
  07_Quality_Checks/       Quality_Check_Report.md
  14_Growth_Projection/    growth projection, model note and sensitivity
```

`Gross_Streaming_Revenue.csv` and `Gross_Export_Revenue.csv` reproduce the first submission's `=== PERIOD TOTAL ===` pseudo-rows, so a reader who summed that file the same way gets the same answer here. **Those rows must be excluded when summing** — including them double counts every quarter exactly.

What changed against the first submission

The first submission delivered 5 quarters. This delivers 31. The 26 additional quarters were never previously reported. For the 5 that overlap, the figures are **restated** under the current methodology; the full reconciliation, closing to \$0.00, is at `_audit/reconciliation/first_submission_vs_delivery134.md`.

Reading the numbers

- **Blank is not zero.** A blank export figure means the split was not measured that quarter, not that nothing was exported. Before Q1 2021 no listener geography exists.
- **Every row states its own basis.** `youtube_views_source` says whether YouTube volume was observed or estimated; `spotify_listeners_source` does the same for Spotify. 1,876 of 3,798 rows carry observed YouTube volume, 919 are estimated, and 1,003 have no YouTube presence at all.
- **Employment is national.** It is the whole Nigerian music sector from secondary sources. It is not a count of these artists' employees and is not scaled to them.
- **Costs are recomputed on this cohort,** not filtered from a larger population.
- **The projection is EST.** It describes quarters that have not happened and must never be summed into an observed total.
